P1Map

Notes

- Coverage: 47 stations in North America, 30 in Oceania, 24 in Europe, 1 in Asia, none in Africa or South America. The US and Australia are 59% of the stations. This is not a global network.
- "Extreme" means extreme for that station's own climate: above the 95th percentile (or below the 5th) of the same calendar days in 1991-2020. It is not an absolute temperature.
- Some tropical-island stations show unrealistic counts (for example 176 cold-snap days at Pago Pago in 1967, 186 cold days at Chuuk in 1999). Where daily variation is tiny, a small shift or a recording change gives huge counts.
- Dry spells are a dry-regime measure, not an official drought. On the map, Dry spells shows the trend in days per decade.
- Regions differ in size: all 23 Australian stations form one region ("Australia"), while 24 of the 42 regions have a single station, so region averages are not comparable in size.
